Abstract. In the previous works of the authors, a step-by-step algorithm FOP which uses any *fixed order of points* in the projective plane $PG(2,q)$ is proposed to construct small complete arcs. In each step, the algorithm adds to a current arc the first point in the fixed order not lying on the bisecants of the arc. The algorithm is based on the intuitive postulate that $PG(2,q)$ contains a sufficient number of relatively small complete arcs. Also, in the previous papers, it is shown that the type of order on the points of $PG(2,q)$ is not relevant. **A complete lexiarc** in $PG(2,q)$ is a complete arc obtained by the algorithm FOP using the lexicographical order of points. In this work, we **collect and analyze the sizes of complete lexiarcs** in the following regions:

all $q \leq 321007$, q prime power;
15 sporadic q's in the interval $[323761 \ldots 430007]$, see (1.10).

In the work [9], the *smallest known* sizes of complete arcs in $PG(2,q)$ are collected for all $q \leq 160001$, q prime power. The sizes of complete arcs, collected in this work and in [9], provide the following upper bounds on the smallest size $t_2(2,q)$ of a complete arc in the projective plane $PG(2,q)$:

$$t_2(2,q) < 0.998\sqrt{3q \ln q} < 1.729\sqrt{q \ln q} \qquad \text{for} \qquad 7 \leq q \leq 160001;$$
$$t_2(2,q) < 1.05\sqrt{3q \ln q} < 1.819\sqrt{q \ln q} \qquad \text{for} \qquad 7 \leq q \leq 321007.$$

Our investigations and results allow to conjecture that the bound $t_2(2,q) < 1.05\sqrt{3q \ln q} < 1.819\sqrt{q \ln q}$ holds for all $q \geq 7$.

It is noted that sizes of the random complete arcs and complete lexiarcs behave similarly. This work can be considered as a continuation and development of the paper [11].

Keywords. Projective planes, complete arcs, small complete arcs, upper bounds, algorithm FOP, randomized greedy algorithms

1 Introduction. The main results

Let $PG(2,q)$ be the projective plane over the Galois field $\mathbb{F}_q$ of q elements. An n-arc is a set of n points no three of which are collinear. An n-arc is called complete if it is not contained in an $(n+1)$-arc of $PG(2,q)$. For an introduction to projective geometries over finite fields see [56, 58, 59, 80].

The relationship among the theory of n-arcs, coding theory, and mathematical statistics is presented in [40, 58, 59, 63, 66, 67]. In particular, a complete arc in the plane $PG(2,q)$, the points of which are treated as 3-dimensional q-ary columns, defines a parity check matrix of a q-ary linear code with codimension 3, Hamming distance 4, and covering radius 2. Arcs can be interpreted as linear maximum distance separable (MDS) codes [85, Sec. 7], [87] and

they are related to optimal coverings arrays [54], superregular matrices [61], and quantum codes [26].

A point set $S \subset \mathrm{PG}(2, q)$ is 1-*saturating* if any point of $\mathrm{PG}(2, q) \setminus S$ is collinear with two points in S [19–21, 24, 37, 38, 49, 73, 88]. In the literature, 1-saturating sets are also called "saturated sets", "spanning sets", and "dense sets". The points of a 1-saturating set in $\mathrm{PG}(2, q)$ form a parity check matrix of a *linear covering code* with codimension 3, Hamming distance 3 or 4, and covering radius 2. An open problem is to find small 1-saturating sets (respectively, short covering codes). A complete arc in $\mathrm{PG}(2, q)$ is, in particular, a 1-saturating set; often the smallest known complete arc is the smallest known 1-saturating set [24, 37, 38, 49, 75]. Let $\ell_1(2, q)$ be the smallest size of a 1-saturating set in $\mathrm{PG}(2, q)$. In [21], combining approaches of [73] and [8], the following upper bound is proved for arbitrary q:

$$\ell_1(2, q) \leq \sqrt{q(3 \ln q + \ln \ln q)} + \sqrt{\frac{q}{3 \ln q}} + 3. \tag{1.1}$$

Let $t_2(2, q)$ be **the smallest size of a complete arc in the projective plane** $\mathrm{PG}(2, q)$**.**

One of the main problems in the study of projective planes, which is also of interest in coding theory, is the determination of the spectrum of possible sizes of complete arcs. In particular, the value of $t_2(2, q)$ is interesting. Finding estimates of the minimum size $t_2(2, q)$ is a hard open problem, see e.g. [60, Sec. 4.10].

This paper is devoted to *upper bounds* on $t_2(2, q)$.

Surveys of results on the sizes of plane complete arcs, methods of their construction, and the comprehension of the relating properties can be found in [5, 6, 8–11, 13, 15, 18, 23, 33, 34, 43, 49, 55, 56, 58–60, 62, 76, 77, 80–82, 84–86].

Problems connected with small complete arcs in $\mathrm{PG}(2, q)$ are considered in [1–18, 22, 24, 25, 27, 31–38, 41–53, 55–60, 62, 64, 68–71, 74–77, 79–86, 89–92], see also the references therein.

The exact values of $t_2(2, q)$ are known only for $q \leq 32$; see [2, 24, 31, 32, 42, 52, 56, 57, 70, 71]. The following lower bounds hold (see [3, 27, 79] and the references therein):

$$t_2(2, q) > \begin{cases} \sqrt{2q} + 1 & \text{for any } q, \\ \sqrt{3q} + \frac{1}{2} & \text{for } q = p^h, \ p \text{ prime}, \ h = 1, 2, 3. \end{cases} \tag{1.2}$$

Let $t(\mathcal{P}_q)$ be the size of the smallest complete arc in any (not necessarily Desarguesian) projective plane $\mathcal{P}_q$ of order q. In [62], for q *large enough*, the following result is proved by *probabilistic methods* :

$$t(\mathcal{P}_q) \leq \sqrt{q} \ln^C q, \ C \leq 300, \tag{1.3}$$

where C is a constant independent of q (so-called universal or absolute constant). Surveys and results of random constructions for geometrical objects in $\mathrm{PG}(2, q)$ can be found in [19–21, 28, 45, 62, 65, 73].

In $\mathrm{PG}(2, q)$, complete arcs are obtained by *algebraic constructions* (see [59, p. 209]) with sizes approximately $\frac{1}{3}q$ [1, 13, 64, 81–83, 92], $\frac{1}{4}q$ [13, 64, 84], $2q^{0.9}$ for $q > 7^{10}$ [81], and

$2.46q^{0.75} \ln q$ for big prime q [53]. It is noted in [45, Sec. 8] that the smallest size of a complete arc in $\mathrm{PG}(2, q)$ obtained via algebraic constructions is

$$cq^{3/4} \tag{1.4}$$

where c is a universal constant [84, Sec. 3], [85, Th. 6.8].

There is a substantial gap between the known upper bounds and the lower bounds on $t_2(2, q)$, see (1.2)–(1.4). The gap is reduced if one considers the lower bound (1.2) for complete arcs and the upper bound (1.1) for 1-saturating sets. However, though complete arcs are 1-saturating sets, they represent a narrower class of objects. Therefore, for complete arcs, one may not use the bound (1.1) directly. Nevertheless, the common nature of complete arcs and 1-saturating sets allows to hope for upper bounds on $t_2(2, q)$ similar to (1.1). The hope is supported by numerous experimental data and some probabilistic conjectures, see below.

In [62, p. 313], it is noted (with reference to the work [27]) that in a preliminary report of 1989, J.C. Fisher obtained by computer search complete arcs in many planes of small orders and conjectured that the average size of a complete arc in $\mathrm{PG}(2, q)$ is about $\sqrt{3q \log q}$.

In [8], see also [7], an attempt to obtain a theoretical upper bound on $t_2(2, q)$ with the main term of the form $c\sqrt{q \ln q}$, where c is a small universal constant, is done. The reasonings of [8] are based on the explanation of the working mechanism of a step-by-step greedy algorithm for constructing complete arcs in $\mathrm{PG}(2, q)$ and on quantitative estimations of the algorithm. For more than half of the steps of the iterative process, these estimations are proved rigorously. The natural (and well-founded) conjecture that they hold for the rest of steps is done, see [8, Conject. 2]. As a result, in [8], the following conjectural upper bounds are formulated.

Conjecture 1.1. [8] *Let $t_2(2, q)$ be the smallest size of a complete arc in the projective plane* $\mathrm{PG}(2, q)$. *Under conjecture given in* [8, Conject. 2], *the following upper bounds hold:*

$$t_2(2, q) < \sqrt{q(3\ln q + \ln \ln q + \ln 3)} + \sqrt{\frac{q}{3\ln q}} + 3, \tag{1.5}$$

$$t_2(2, q) < 1.87\sqrt{q \ln q} < 1.08\sqrt{3q \ln q}. \tag{1.6}$$

Moreover, in [8] it is conjectured that the upper bounds (1.5), (1.6) hold for all q without any extra conditions.

Denote by $\bar{t}_2(2, q)$ **the smallest *known* size of a complete arc in the projective plane** $\mathrm{PG}(2, q)$**.** Clearly,

$$t_2(2, q) \le \bar{t}_2(2, q).$$

For even $q = 2^h$, small complete arcs in planes are a base for inductive infinite families of small complete caps in the projective spaces $\mathrm{PG}(N, q)$, see [36]. For $h \le 17$, the smallest known sizes of complete arcs in $\mathrm{PG}(2, 2^h)$ are collected in [6, 8], see also [13, 15, 34, 36, 41].

Also, $(6\sqrt{q} - 6)$-arcs in $\mathrm{PG}(2, 4^{2a+1})$, are constructed in [35]; for $a \le 4$ it is proved that they are complete. This gives a complete 3066-arc in $\mathrm{PG}(2, 2^{18})$. In particular, it holds that

$$\bar{t}_2(2, 2^9) = 85,\ \bar{t}_2(2, 2^{10}) = 124,\ \bar{t}_2(2, 2^{11}) = 199,\ \bar{t}_2(2, 2^{12}) = 300,\ \bar{t}_2(2, 2^{13}) = 449,$$
$$\bar{t}_2(2, 2^{14}) = 665,\ \bar{t}_2(2, 2^{15}) = 987,\ \bar{t}_2(2, 2^{16}) = 1453,\ \bar{t}_2(2, 2^{17}) = 2141,\ \bar{t}_2(2, 2^{18}) = 3066.$$

For prime powers $q \le 13627$, the values of $\bar{t}_2(2, q)$ (up to January 2013) are collected in [13, 15]. For prime powers $q \le 49727$ and prime $q \le 150001$, the values of $\bar{t}_2(2, q)$ (up to August 2014) are collected in [6]. For $q \le 151$, a number of improvements of $\bar{t}_2(2, q)$, in comparison with [13, 15], are given in [75] and cited in [6].

From the results of [6, 13, 15], see also [36, 41, 46, 51], it follows that

$$t_2(2, q) < 4\sqrt{q} \quad \text{for } q \le 841,\ q = 857, 31^2, 2^{10}, 37^2, 41^2, 7^4;$$
$$t_2(2, q) < 4.5\sqrt{q} \text{ for } q \le 2647,\ q = 2659, 2663, 2683, 2693, 2753, 2801;$$
$$t_2(2, q) < 5\sqrt{q} \text{ for } q \le 9497,\ q = 9539, 9587, 9613, 9623, 9649, 9689, 9923, 9973;$$
$$t_2(2, q) < 5.5\sqrt{q} \text{ for } q \le 38557,\ q \ne 36481, 37537, 37963, 38039, 38197.$$

Let Q_1 be a set of 34 sporadic q's in the interval $[160801 \ldots 430007]$, see [9, Tab. 3]. Let Q be a set of values of q. We have

$$Q_1 = \{160801, 161009, 162007, 163003, 164011, 165001, 166013, 167009, 168013, \quad (1.7)$$
$$169003, 170503, 178169, 180001, 185021, 190027, 200003, 210011, 250007, 260003,$$
$$262144, 270001, 280001, 290011, 300007, 330017, 350003, 360007, 370003, 380041,$$
$$390001, 400009, 410009, 420001, 430007\};$$
$$Q = \{2 \le q \le 160001, q \text{ prime power}\} \cup Q_1. \quad (1.8)$$

For $q \in Q$, the values of $\bar{t}_2(2, q)$ are obtained in the works [4–6, 8, 9, 11, 13, 15, 22], see also the references therein.

All the values of $\bar{t}_2(2, q)$ (up to June 2015), $q \in Q$, are collected in the work [9].

Note that, for $q \in Q$, in the works [4–6, 8, 9, 11–13, 15], the most of the values $\bar{t}_2(2, q)$ have been obtained by computer search using *randomized greedy algorithms* described in [11, 13, 15, 18, 33, 34, 39]. In each step, a step-by-step greedy algorithm adds to an incomplete current arc a point providing the maximum possible (for the given step) number of new covered points.

We denote by $t_2^G(2, q)$ **the size of a complete arc in** $\mathrm{PG}(2, q)$ **collected in [9].**

An important way to obtain small plane complete arcs is a step-by-step *algorithm with fixed order of points (FOP)*, see [10–12, 16, 18, 22, 25]. The algorithm FOP fixes a particular order on points of $\mathrm{PG}(2, q)$. In each step, the algorithm FOP adds to an incomplete current arc the next point in this order not lying on bisecants of this arc. For both prime and non-prime q, a lexicographical order of points can be used, see Section 2.

5

Definition 1.2. **We call a *lexiarc* an arc obtained by the algorithm FOP using the lexicographical order of points**.

Let $t_2^L(2, q)$ be **the size of a complete lexiarc in the projective plane** $\mathrm{PG}(2, q)$.

Note that the sizes of complete arcs obtained by the algorithm FOP vary insignificantly with respect to the order of points, see [10, 18, 22, 25]. In particular, for the lexicographical order of points described in Section 2, in the case of *prime q, the size $t_2^L(2, q)$ of a complete lexiarc and its set of points depend on q only*. No other factors affect size and structure of a complete lexiarc.

Let L_1, L_2, L_3, and L be the following sets of values of q:

$$L_1 = \{q \leq 301813, \ q \text{ prime power}\}; \tag{1.9}$$

$$L_2 = \{323761, 326041, 330017, 332929, 340007, 344569, 350003, 360007, \tag{1.10}$$
$$370003, 380041, 390001, 400009, 410009, 420001, 430007\};$$

$$L_3 = \{301813 < q \leq 321007, \ q \text{ prime power}\}; \tag{1.11}$$

$$L = L_1 \cup L_2 \cup L_3 = \{q \leq 321007, \ q \text{ prime power}\} \cup L_2. \tag{1.12}$$

For $q \in L_1 \cup L_2$, the values of $t_2^L(2, q)$ are obtained in [10–12, 16, 18, 25] and collected in the work [10]. For $q \in L_3$, the values of $t_2^L(2, q)$ *are obtained in this work*.

All the values of $t_2^L(2, q)$, $q \in L$, are collected in this work.

It should be emphasized that in this work, to obtain upper bounds, we use the computer search results for **all prime powers** q in the regions $q \leq 160001$ with greedy algorithms and $q \leq 321007$ with the algorithm FOP. In this sense, we say that **computer search** in the noted regions is **complete**.

Complete arcs obtained by greedy algorithms have smaller sizes than complete lexiarcs, however the greedy algorithms take essentially greater computer time than the algorithm FOP. This is why the complete computer search for all prime powers q with the help of greedy algorithms is done for $q \leq 160001$ [9] whereas the complete search by algorithm FOP is executed for $q \leq 321007$. So, we have, see Figure 1 in Section 3,

$$\bar{t}_2(2, q) = \begin{cases} t_2^G(2, q) & \text{if} \quad q \in Q = \{2 \leq q \leq 160001\} \cup Q_1 \\ t_2^L(2, q) & \text{if} \quad q \in L \setminus Q = (\{160001 < q \leq 321007\} \cup L_2) \setminus Q_1 \end{cases}. \tag{1.13}$$

In the works of the authors [4, 15, 18, 22, 25], non-standard types of upper bounds on $t_2(2, q)$ are proposed. In particular, in the paper [11], the function $h(q)$ is defined so that

$$t_2(2, q) = h(q)\sqrt{3q \ln q}. \tag{1.14}$$

Using the function $h(q)$ instead of $t_2(2, q)$ allows to do estimates and graphics more expressive, see Figures 1, 6 in Section 3.

The following theorem summarizes the main results of this work. The theorem is based on the complete computer search, the results of which are collected in [5, 6, 9–11, 13, 15, 16], (see also the references therein) and in Tables 1 − 6 of this paper.

Theorem 1.3. *Let $t_2(2, q)$ be the smallest size of a complete arc in the projective plane* $\text{PG}(2, q)$. *Let $\bar{t}_2(2, q)$ be the smallest known size of a complete arc in* $\text{PG}(2, q)$. *Let L_2 be given by* (1.10). *The following upper bounds hold:*

$$t_2(2, q) < \bar{t}_2(2, q) < 0.998\sqrt{3q \ln q} < 1.729\sqrt{q \ln q} \quad for \quad 7 \le q \le 160001; \tag{1.15}$$

$$t_2(2, q) < \bar{t}_2(2, q) < 1.05\sqrt{3q \ln q} < 1.819\sqrt{q \ln q} \quad for \quad 7 \le q \le 321007 \ and \ q \in L_2. \tag{1.16}$$

For $q \le 160001$, complete arcs in $\text{PG}(2, q)$ *satisfying the upper bounds* (1.15) *can be constructed with the help of the step-by-step greedy algorithm which adds to an incomplete current arc, in each step, a point providing the maximum possible (for the given step) number of new covered points.*

For $160001 < q \le 321007$ and $q \in L_2$, complete arcs in $\text{PG}(2, q)$ *satisfying the upper bounds* (1.16) *can be constructed as lexiarcs with the help of the algorithm FOP using the lexicographical order of points. The only exception is $q = 178169$ for which a complete arc satisfying* (1.16) *can be obtained by the greedy algorithm.*

Calculations executed for sporadic $q \le 430007$ ($q \in L_2$ of (1.10)) strengthen the confidence for validity of the bounds of Theorem 1.3, see also Figures 1 – 3 in Section 3. Also, it is important that the bounds (1.15), (1.16) are close to the conjectural (but well-founded) bounds of [8], see (1.5), (1.6) in Conjecture 1.1 and Figures 4, 5 in Section 3. On the whole, our investigations and results (again see figures in Section 3) allow to conjecture that the bound (1.16) holds for all q.

Conjecture 1.4. *Let $t_2(2, q)$ be the smallest size of a complete arc in the projective plane* $\text{PG}(2, q)$. *The following upper bound holds:*

$$t_2(2, q) < 1.05\sqrt{3q \ln q} < 1.819\sqrt{q \ln q} \ for \ all \ q \ge 7.$$

The paper is organized as follows. In Section 2, the algorithm with fixed order of points (FOP) is considered. The lexicographical order of points is described and lexiarcs are defined. In Section 3, upper bounds on $t_2(2, q)$, based on sizes of complete lexiarcs in $\text{PG}(2, q)$ and on sizes of complete arcs collected in [9], are proposed. In Section 4, the common nature lexiarcs and random arcs is considered. In Section 5, the list of tables with sizes of complete lexiarcs in the projective plane $\text{PG}(2, q)$ is given. In Conclusion the results of this paper are briefly analyzed. In Appendix, tables of sizes of complete lexiarcs in the projective plane PG(2,q), obtained in this paper and in the previous works of the authors, are collected.

2   Algorithm with fixed order of points (FOP). Lexiarcs

2.1   Step-by-step algorithm FOP

We use results and approaches of the works [10, 12, 16, 18, 22, 25]. Consider the projective plane $\text{PG}(2, q)$ and fix a particular order on its points. The algorithm FOP builds a complete

arc **iteratively, step-by-step**.

Let $K^{(j)}$ be the arc obtained on the j-th step. On the next step, the first point in the fixed order not lying on the bisecants of $K^{(j)}$ is added to $K^{(j)}$.

Algorithm FOP. Suppose that the points of PG$(2, q)$ are ordered as $A_1, A_2, \ldots, A_{q^2+q+1}$. Consider the empty set as root of the search and let $K^{(j)}$ be the partial solution obtained in the j-th step, as extension of the root. We put

$$K^{(0)} = \emptyset, \ K^{(1)} = \{A_1\}, \ K^{(2)} = \{A_1, A_2\}, \ m(1) = 2, \tag{2.1}$$
$$K^{(j+1)} = K^{(j)} \cup \{A_{m(j)}\},$$
$$m(j) = \min\{i \in [m(j-1) + 1, q^2 + q + 1] \mid \nexists \ P, Q \in K^{(j)} : \ A_i, P, Q \text{ are collinear}\},$$

i.e. $m(j)$ is the minimum subscript i such that the corresponding point A_i is not saturated by $K^{(j)}$. The process ends when a complete arc is obtained.

Remark 2.1. A point of PG$(2, q)$ can be treated as a 3-vector column of a code parity check matrix. Then, formally, the algorithm FOP can be considered as a version of the recursive g-parity check algorithm for greedy codes of codimension $r = 3$ and minimum distance $d = 4$, see e.g. [30, p. 25], [72], [78, Section 7].

However, in coding theory, for given r, d, the aim is to get a *long* code while our goal is to obtain a *short* complete arc. Moreover, our estimates and computer search show that for $r = 3$, $d = 4$, the algorithm FOP gives "bad" codes, essentially shorter than "good" codes corresponding to ovals and hyperovals.

Finally, note that we do not use a word "greedy" in the name of the algorithm FOP, as in projective geometry the terms "greedy algorithm" and "randomized greedy algorithm" are traditionally connected with other approaches, see [11, 13, 15, 18, 33, 34, 39].

2.2   Lexicographical order of points

In the beginning, we consider q prime. Let the elements of the field $\mathbb{F}_q = \{0, 1, \ldots, q-1\}$ be treated as integers modulo q. Let the points A_i of PG$(2, q)$ be represented in homogenous coordinates so that

$$A_i = (x_0^{(i)}, x_1^{(i)}, x_2^{(i)}), \ x_j^{(i)} \in \mathbb{F}_q, \tag{2.2}$$

where the leftmost non-zero element is 1. For A_i, we put

$$i = x_0^{(i)} q^2 + x_1^{(i)} q + x_2^{(i)}. \tag{2.3}$$

So, the homogenous coordinates of a point A_i are treated as its number i written in the q-ary scale of notation. Recall that the points of PG$(2, q)$ are ordered as $A_1, A_2, \ldots, A_{q^2+q+1}$.

It is important that **for such lexicographical order for *prime* q, the size $t_2^L(2, q)$ of a complete lexiarc and its set of points depend on q only**. No other factors affect size and structure of a complete lexiarc.

8

Now let $q = p^m$, p prime, $m \geq 2$. Let $F_q(x)$ be a primitive polynomial of $\mathbb{F}_{p^m}$ and let α be a root of $F_q(x)$. Elements of $\mathbb{F}_{p^m}$ are represented by integers as follows

$$\mathbb{F}_{p^m} = \mathbb{F}_q = \{0, 1 = \alpha^0, 2 = \alpha^1, \ldots, q - 1 = \alpha^{q-2}\}.$$

Then we again use (2.2) and (2.3). However for non-prime q the size $t_2^L(2, q)$ of a complete lexiarc depends on q and on the form of the polynomial $F_q(x)$. In this work we use primitive polynomials that are created by the program system MAGMA [29] by default, see Table A where polynomials for $q < 36000$ are given. In any case, the choice of the polynomial changes the size of complete lexiarc inessentially.

We have noted in Introduction that, in general, the sizes of complete arcs obtained by the algorithm FOP vary insignificantly with respect to the order of points. In particular, in [18, 22, 25] the so-called Singer order of points (based on the Singer group of collineations) is considered and it is shown that in the region $5000 < q \leq 40009$, q prime, the difference between the sizes of complete arcs obtained using the lexicographical order and the Singer order is less then 2% and none of the two orders gives the smallest size for all q.

2.3 Starting points of lexiarcs in $\mathrm{PG}(2, q)$, q prime

Proposition 2.2. *Let q be a prime. Then the j-th point of a lexiarc in $\mathrm{PG}(2, q)$ is the same for all $q \geq q_0(j)$ where $q_0(j)$ is large enough.*

Proof. Suppose that, in (2.1), at a certain step j we have $K^{(j)} \setminus K^{(j-1)} = \{P\}$, with $P = A_s$. A point $Q = A_r \notin K^{(j)}$ will be the next chosen point in the extension process if and only if all the points A_i with $i \in [s+1, r-1]$ are covered by $K^{(j)}$. That is, for any $i \in [s+1, r-1]$ at least one of the determinants of the coordinates of the points P_1, P_2, A_i, with $P_1, P_2 \in K^{(j)}$, is equal to zero modulo q. This can happen only for two reasons:

1. $\det(P_1, P_2, A_i) = 0$: we say that A_i is "absolutely" covered by $K^{(j)}$;

2. $\det(P_1, P_2, A_i) = m \neq 0$, with $m \equiv 0 \bmod q$.

It is clear that, for q large enough, q does not divide any of the possible $m = \det(P_1, P_2, A_i)$ and then, at least for j "small", the points covered are just the absolutely covered points. Therefore, when q is large enough the lexiarcs share a certain number of points. $\qquad \square$

The values of $q_0(j)$ can be found with the help of calculations based on the proof of Proposition 2.2. Also, we can directly consider lexiarcs constructed by the algorithm FOP for a convenient region of q.

Example 2.3. Values of $q_0(j)$, $j \leq 24$, together with the homogenous coordinates (a_0, a_1, a_2) of the common points, are given in Table B. So, for all prime $q \geq 251$ the first 24 points of a lexiarc are as in Table B. Since $t_2^L(2, 251) = 63$ [16], we know $24/63 \approx 38\%$ of complete lexiarc points for $q = 251$. For growing q this percentage decreases (relatively slowly). For instance, for $q \approx 270000$ it is $\approx 20\%$.

9

Table A. Primitive polynomials used for lexiarcs in $\mathrm{PG}(2,q)$ with non-prime q

$q = p^m$	primitive polynomial	$q = p^m$	primitive polynomial	$q = p^m$	primitive polynomial
$4 = 2^2$	$x^2 + x + 1$	$8 = 2^3$	$x^3 + x + 1$	$9 = 3^2$	$x^2 + 2x + 2$

3 Upper bounds on $t_2(2,q)$, $q \in L$

For bounds, we use data on sizes $t_2^L(2,q)$, $q \in L$, of complete lexiarcs in $\mathrm{PG}(2,q)$ obtained and collected in $[10, 12, 16, 18, 22, 25]$ and in Tables $1-6$ of this work, see Appendix. Also, we use data on sizes $t_2^G(2,q)$, $q \in Q$, collected in $[9]$. Here L and Q are given by (1.12) and (1.8), respectively.

In Table 1, for $4 \le q \le 316969$, q non-prime, the sizes $t_2^L(2,q)$ (for short t_2^L) of complete lexiarcs in $\mathrm{PG}(2,q)$ are collected.

In Table 2, for 15 sporadic q's in the interval $[323761 \ldots 430007]$, the sizes $t_2^L = t_2^L(2,q)$ of complete lexiarcs in $\mathrm{PG}(2,q)$ are written. All $q \in L_2$, see (1.10), are included in this table.

In Tables $3-6$, for **all prime powers** $q \le 321007$ the sizes $t_2^L = t_2^L(2,q)$ of complete lexiarcs in $\mathrm{PG}(2,q)$ are collected.

We define the functions $h^L(q)$ and $h^G(q)$ as follows.

$$t_2^L(2,q) = h^L(q)\sqrt{3q \ln q}; \tag{3.1}$$
$$t_2^G(2,q) = h^G(q)\sqrt{3q \ln q}.$$

Figure 1 shows the following: the conjectural upper bound (1.5) of $[8]$ divided by $\sqrt{3q \ln q}$ (the top dashed red curve); values $h^L(q) = t_2^L(2,q)/\sqrt{3q \ln q}$ for complete lexiarcs in $\mathrm{PG}(2,q)$, $q \in L$ of (1.12) (the 2-nd solid black curve); values $h^G(q) = t_2^G(2,q)/\sqrt{3q \ln q}$ for complete arcs in $\mathrm{PG}(2,q)$ collected in $[9]$, $q \in Q$ of (1.8) (the bottom solid blue curve); upper bounds "1.05" and "0.998" (the horizontal dashed red lines). Vertical dashed-dotted magenta lines mark regions $q \le 160001$ and $q \le 321007$ of the complete computer search for all prime powers q.

Figure 2 shows the upper bound $1.05\sqrt{3q \ln q}$ (the top dashed-dotted red curve), see (1.16), sizes $t_2^L(2,q)$ of complete lexiarcs in $\mathrm{PG}(2,q)$, $q \in L$ of (1.12) (the 2-nd solid black curve), and sizes $t_2^G(2,q)$ for complete arcs collected in $[9]$, $q \in Q$ of (1.8) (the bottom solid blue curve). Vertical dashed-dotted magenta lines mark regions $q \le 160001$ and $q \le 321007$.
Figure 1: **Conjectural upper bound** (1.5) **of [8] vs sizes** $t_2^L(2,q)$ **of complete lexiarcs and sizes** $t_2^G(2,q)$ **of complete arcs collected in [9] (all values are divided by** $\sqrt{3q\ln q}$**):** conjectural upper bound (1.5) of [8] divided by $\sqrt{3q\ln q}$ (*top dashed red curve*); values $h^L(q) = t_2^L(2,q)/\sqrt{3q\ln q}$ for complete lexiarcs in PG$(2,q)$, $q \in L$ (*the 2-nd solid black curve*); values $h^G(q) = t_2^G(2,q)/\sqrt{3q\ln q}$ for complete arcs collected in [9], $q \in Q$ (*bottom solid blue curve*); upper bounds "1.05", "0.998" (*horizontal dashed red lines*). *Vertical dashed-dotted magenta lines* mark regions $q \le 160001$ and $q \le 321007$ of the complete computer search for all prime powers q

The curves of $1.05\sqrt{3q\ln q}$ and $t_2^L(2,q)$ almost coalesce with each other in the scale of Figure 2. It should be noted that $1.05\sqrt{3q\ln q} > t_2^L(2,q)$ if $q \geq 106627$ and $q \neq 178169$. In the other side, we have $1.05\sqrt{3q\ln q} > t_2^G(2,q)$ for all $q \in Q$, including $q = 178169$, see (1.7), (1.8). So, in fact, $1.05\sqrt{3q\ln q}$ is the upper bound on $t_2(2,q)$ for all $q \in L$.
Figure 2: **Upper bound** $1.05\sqrt{3q\ln q}$ **vs sizes** $t_2^L(2,q)$ **of complete lexiarcs and sizes** $t_2^G(2,q)$ **of complete arcs collected in [9]:** upper bound $1.05\sqrt{3q\ln q}$ (*top dashed-dotted red curve*); sizes $t_2^L(2,q)$ of complete lexiarcs in $\mathrm{PG}(2,q)$, $q \in L$ (*the 2-nd solid black curve*); sizes $t_2^G(2,q)$ for complete arcs collected in [9], $q \in Q$ (*bottom solid blue curve*). *Vertical dashed-dotted magenta lines* mark regions $q \leq 160001$ and $q \leq 321007$

Figure 3 presents the difference $1.05\sqrt{3q\ln q} - t_2^G(2,q)$ between the upper bound $1.05\sqrt{3q\ln q}$ and the sizes $t_2^G(2,q)$ of complete arcs in $\mathrm{PG}(2,q)$ collected in [9], $q \in Q$ of (1.8). The vertical dashed-dotted magenta line marks the region $q \leq 160001$ of the complete computer search. The "tooth" on the graphics corresponds to $\bar{t}_2(2,2^{18}) = 3066$ [35].

13
Figure 3: **Difference** $1.05\sqrt{3q\ln q} - t_2^G(2, q)$ **between upper bound** $1.05\sqrt{3q\ln q}$ **and sizes** $t_2^G(2, q)$ **of complete arcs in** $\mathrm{PG}(2, q)$, **collected in [9],** $q \in Q$. *Vertical dashed-dotted magenta line* marks region $q \leq 160001$ of the complete computer search

Observation 3.1. *The difference* $1.05\sqrt{3q\ln q} - t_2^G(2, q)$ *between the upper bound* $1.05\sqrt{3q\ln q}$ *and sizes* $t_2^G(2, q)$ *of complete arcs in* $\mathrm{PG}(2, q)$, *collected in* [9], *tends to increase when q grows.*

In Figure 4, the conjectural upper bound from [8] $\sqrt{q(3\ln q + \ln\ln q + \ln 3)} + \sqrt{\frac{q}{3\ln q}} + 3$, see (1.5) (the top dashed-dotted red curve) and the sizes $t_2^L(2, q)$ of complete lexiarcs in $\mathrm{PG}(2, q)$, $q \in L$ of (1.12) (the bottom solid black curve) are shown. The vertical dashed-dotted magenta line marks region $q \leq 321007$.
Figure 4: **Conjectural upper bound** (1.5) **of** [8] **vs sizes** $t_2^L(2, q)$ **of complete lexiarcs in** $\mathrm{PG}(2, q)$**:** conjectural upper bound of [8] (*top dashed-dotted red curve*); sizes $t_2^L(2, q)$ of complete lexiarcs in $\mathrm{PG}(2, q)$, $q \in L$ (*bottom solid black curve*). *Vertical dashed-dotted magenta line* marks region $q \leq 321007$ of the complete computer search

15

Figure 5 presents the difference

$$\left(\sqrt{q(3\ln q + \ln\ln q + \ln 3)} + \sqrt{\frac{q}{3\ln q}} + 3\right) - t_2^L(2,q)$$

between the conjectural upper bound (1.5) from [8] and the sizes $t_2^L(2,q)$ of complete lexiarcs in $PG(2,q)$.

Figure 5: **Difference** $\left(\sqrt{q(3\ln q + \ln 3\ln q + \ln 3)} + \sqrt{\frac{q}{3\ln q}} + 3\right) - t_2^L(2,q)$ **between the conjectural upper bound** (1.5) **from** [**8**] **and the sizes** $t_2^L(2,q)$ **of complete lexiarcs in** $PG(2,q)$, $q \in L$

**Observation 3.2.** *The difference* $\left(\sqrt{q(3\ln q + \ln\ln q + \ln 3)} + \sqrt{\frac{q}{3\ln q}} + 3\right) - t_2^L(2,q)$ *between the conjectural upper bound* (1.5) *from* [8] *and the sizes* $t_2^L(2,q)$ *of complete lexiarcs in* $PG(2,q)$ *tends to increase when q grows.*

Data for $q \in L$ of (1.12), collected in Tables $1 - 6$, give rise to Theorems 3.3 and 3.4 on upper and lower bounds on $h^L(q)$.

Theorem 3.3. *Let the functions $h(q)$ and $h^L(q)$ be as in (1.14) and (3.1). Let L_2 be the set of values of q given by (1.10) and Table 2. In $\mathrm{PG}(2, q)$ the following upper bounds are provided by complete lexiarcs:*

$$h(q) \le h^L(q) < \begin{cases} 1.056 & for & 16 \le q \le 18443 \\ 1.053 & for & 18443 < q \le 80407 \\ 1.051 & for & 80407 < q \le 178169 \\ 1.050 & for & 178169 < q \le 315701 \\ 1.048 & for & 315701 < q \le 321007 \ and \ q \in L_2 \end{cases};$$

$$h(q) \le h^L(q) < 1.05 \ for \ 106627 \le q \le 321007 \ and \ q \in L_2, \quad q \ne 178169. \qquad (3.2)$$

Theorem 3.4. *Let the function $h^L(q)$ be as in (3.1). Let L_2 be the set of values of q given by (1.10) and Table 2. In $\mathrm{PG}(2, q)$ the following lower bounds on $h^L(q)$ hold.*

$$h^L(q) > \begin{cases} 1.023 & for & 11971 \le q \le 34583 \\ 1.028 & for & 34583 < q \le 70451 \\ 1.032 & for & 70451 < q \le 159349 \\ 1.033 & for & 159349 < q \le 192133 \\ 1.034 & for & 192133 < q \le 297967 \\ 1.036 & for & 297967 < q \le 321007 \ and \ q \in L_2 \end{cases}.$$

Figure 6 illustrates Theorems 3.3, 3.4 and presents the value $h^L(q) = t_2^L(2, q)/\sqrt{3q \ln q}$, $q \in L$ (the solid black curve), and its upper and lower bounds (the dashed red lines) in more detail than Figure 1. Also, the middle line $y = h^L_{\mathrm{mid}} = 1.042$ is shown. The percentage for a bound B is calculated as

$$\frac{B - h^L_{\mathrm{mid}}}{h^L_{\mathrm{mid}}} 100\%, \quad h^L_{\mathrm{mid}} = 1.042, \qquad (3.3)$$

where $B \in \{1.056, 1.053, 1.051, 1.050, 1.048, 1.023, 1.028, 1.032, 1.033, 1.034, 1.036\}$.

By Theorems 3.3, 3.4 and Figure 6, we have the following observation.

Observation 3.5. *For $q \in L$, $q \ge 11971$, the values of $h^L(q) = t_2^L(2, q)/\sqrt{3q \ln q}$ oscillate around the horizontal line $y = 1.042$ with a small amplitude. For growing q, the oscillation amplitude decreases. Upper bounds on the amplitude decrease from 1.4% to 0.6% while lower bounds change from -1.8% to -0.6%, where the percentage corresponds to (3.3). See also Remark 3.6.*
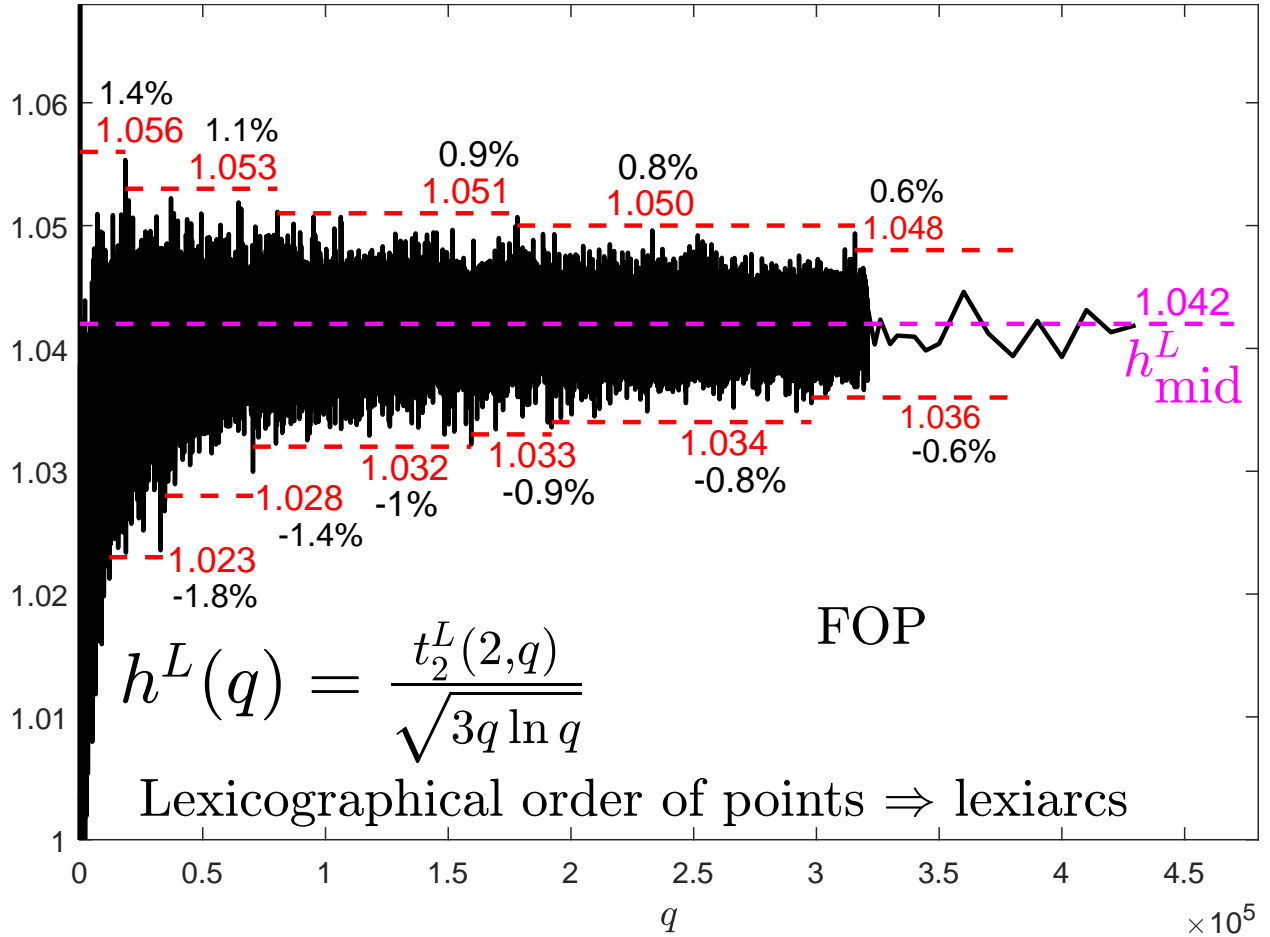

17

Figure 6: **Values of** $h^L(q) = t_2^L(2,q)/\sqrt{3q \ln q}$ **for complete lexiarcs in** $\mathrm{PG}(2,q)$, $q \in L$ (***solid black curve***) **and the corresponding upper and lower bounds (*dashed red lines***). *Magenta line* $y = 1.042$ *is a "middle" line for* $h^L(q)$

Remark 3.6. **(i)** The oscillation (with decreasing amplitude) of $h^L(q)$ around the horizontal line (see Figure 6 and Observation 3.5) is an interesting **enigma** that should be investigated and explained.

(ii) It would be interesting to understand the working mechanism and to do quantitative estimates for the step-by-step algorithm FOP, see (2.1), similarly to the work [8] where the working mechanism of a greedy algorithm is treated.

Proposition 3.7. *Let $t_2(2, q)$ be the smallest size of a complete arc in the projective plane* PG$(2, q)$. *The following upper bound holds:*

$$t_2(2, q) < 1.05\sqrt{3q \ln q} \quad for \quad 7 \leq q \leq 321007, \ q \in L_2.$$

Proof. By [9, Tab. 3], we have $t_2^G(2, 178169) = 2530$, whence $h(178169) < h^G(178169) < 0.996$. Now the assertion follows from (3.2) and (1.15). $\qquad\qquad\qquad\qquad\qquad\square$

4   On the common nature of lexiarcs and random arcs

In this section we compare complete random arcs in PG$(2, q)$ and complete lexiarcs. The random arcs are constructed iteratively. The next point of an incomplete current arc is taken randomly among points that are not covered by the arc bisecants. Let $t_2^R(2, q)$ be the size of a complete random arc in PG$(2, q)$. The values of $t_2^R(2, q)$ for $q \leq 46337$, q prime, are collected in the work [17]. We define a function $h^R(q)$ by

$$t_2^R(2, q) = h^R(q)\sqrt{3q \ln q}.$$

Values of $h^R(q) = t_2^R(2, q)/\sqrt{3q \ln q}$ (the solid green curve) and upper bound $y = 1.054$ (the dashed-dotted red line) for $q \leq 46337$, q prime, are shown in Figure 7.

It is useful to compare sizes of complete lexiarc and complete random arcs. The percentage difference $\Delta^{LR}(q)$ between sizes of complete lexiarcs and complete random arcs in PG$(2, q)$ for $q \leq 46337$, q prime, is shown in Figure 8 in the form

$$\Delta^{LR}(q) = \frac{t_2^L(2, q) - t_2^R(2, q)}{t_2^L(2, q)} 100\%.$$

One can see that the difference $\Delta^{LR}(q)$ is relatively small; it is in the region $\approx \pm 2\%$. Moreover, the difference $\Delta^{LR}(q)$ oscillates around the horizontal line $y = 0$. It means that, perhaps, **lexiarcs and random arcs have the same nature.** This is expected, as the lexicographical order of points is a random order in the geometrical sense.
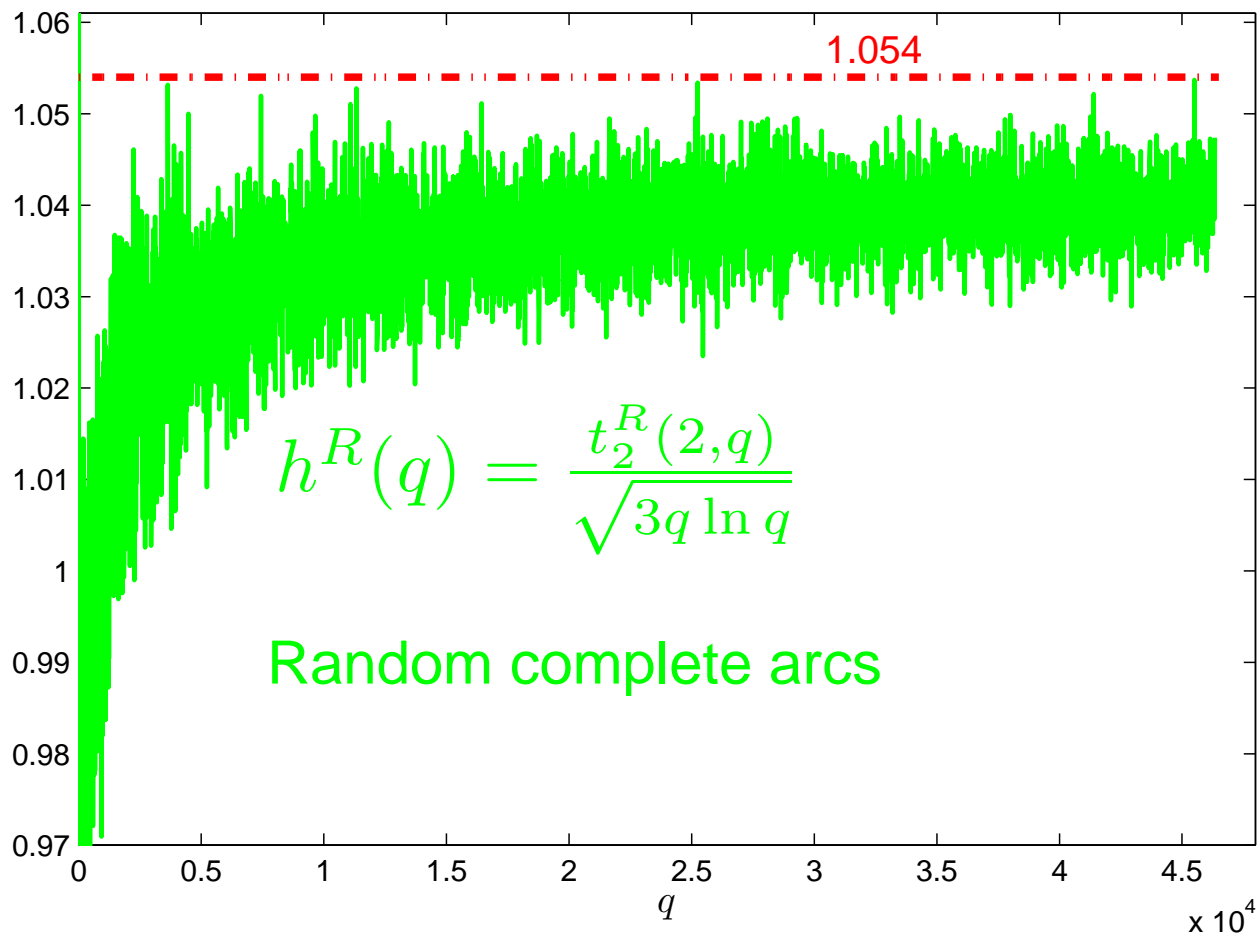

Figure 7: **Values of** $h^R(q) = t_2^R(2, q)/\sqrt{3q \ln q}$ **for complete random arcs in** $\mathrm{PG}(2, q)$, $q \le 46337$, q **prime** (*solid green curve*) and the upper bound $y = 1.054$ (*dashed-dotted red line*)
Figure 8: **Percentage difference $\Delta^{LR}(q)$ between sizes $t_2^L(2,q)$ of complete lexiarcs and sizes $t_2^R(2,q)$ of complete random arcs in $\mathrm{PG}(2,q)$**

$$\Delta^{LR}(q) = \frac{t_2^L(2,q) - t_2^R(2,q)}{t_2^L(2,q)} 100\%$$

5 List of tables with sizes of complete lexiarcs in the projective plane $\mathrm{PG}(2, q)$

Table 1. The sizes $t_2^L = t_2^L(2, q)$ of complete lexiarcs in planes $\mathrm{PG}(2, q)$, $4 \leq q \leq 316969$, q non-prime. **p. 30**

 Table 2. The sizes $t_2^L = t_2^L(2, q)$ of complete lexiarcs in planes $\mathrm{PG}(2, q)$, $323761 \leq q \leq 430007$, sporadic q. **p. 30**

 Table 3. The sizes $t_2^L = t_2^L(2, q)$ of complete lexiarcs in planes $\mathrm{PG}(2, q)$, $3 \leq q < 10000$, q prime power. **pp. 31–34**

 Table 4. The sizes $t_2^L = t_2^L(2, q)$ of complete lexiarcs in planes $\mathrm{PG}(2, q)$, $10000 < q < 100000$, q prime power. **pp. 35–56**

 Table 5. The sizes $t_2^L = t_2^L(2, q)$ of complete lexiarcs in planes $\mathrm{PG}(2, q)$, $100000 < q \leq 301813$, q prime power. **pp. 57–106**

 Table 6. The sizes $t_2^L = t_2^L(2, q)$ of complete lexiarcs in planes $\mathrm{PG}(2, q)$, $301813 < q \leq 321007$, q prime power. **pp. 107–111**

6 Conclusion

This work contains tables of sizes of **small complete arcs** in the projective plane $\mathrm{PG}(2, q)$ for **all** $q \leq 321007$, q prime power, and 15 sporadic q's in the interval $[323761 \ldots 430007]$. These arcs are obtained with the help of a **step-by-step algorithm with fixed order of points (FOP)**, see [10–12, 16, 18, 22, 25]. The algorithm FOP fixes a particular order on points of the projective plane $\mathrm{PG}(2, q)$. In each step, the algorithm FOP adds to an incomplete current arc the next point in this order not lying on bisecants of this arc. For arcs, sizes of which are collected in this work, a **lexicographical order of points** in the algorithm FOP was used. Therefore these arcs are called **_lexiarcs_**.

 In this work, **upper bounds on the smallest size $t_2(2, q)$ of a complete arc in the projective plane** $\mathrm{PG}(2, q)$ are considered on the base of the sizes of complete lexiarcs, collected in this work, and of the smallest known (up to June 2015) sizes of complete arcs in $\mathrm{PG}(2, q)$ for **all** $q \leq 160001$, q prime power, collected in [9].

 For $q \leq 321007$, the _computer search_, the results of which are used in this work, is _complete_, i.e. it has been performed for _all_ q prime powers. This _proves_ that the described upper bound $t_2(2, q) < 1.05\sqrt{3q \ln q}$ is valid, at least, in this region, see (1.16) of Theorem 1.3 and Figure 1. Calculations executed for sporadic $q \leq 430007$ strengthen the confidence in the validity of these bounds for large values of q, see also Figures 1, 2, 3, 6. Moreover, the bounds of Theorem 1.3 are close to the conjectural bounds of [8] cited in Conjecture 1.1, see Figures 4, 5. By all the arguments, we conjecture that the bound $t_2(2, q) < 1.05\sqrt{3q \ln q}$ holds for all q, see Conjecture 1.4.

 The most of the smallest known complete arcs, the sizes of which are collected in [9], are

obtained by computer search using randomized greedy algorithms [11, 13, 15, 18, 33, 34, 39]. In each step, a step-by-step greedy algorithm adds to an incomplete current arc a point providing the maximum possible (for the given step) number of new covered points.

Complete arcs obtained by greedy algorithms have smaller sizes than complete lexiarcs, however the greedy algorithms take essentially greater computer time than the algorithm FOP. This is why the complete computer search for all prime powers q with the help of greedy algorithms is done for $q \leq 160001$ [9] whereas the complete search by algorithm FOP is executed for $q \leq 321007$.

On the other hand, the difference between sizes of complete lexiarcs and the smallest known sizes of complete arcs in PG$(2, q)$ is relatively small; it is $\lesssim 6\%$ for $q \gtrsim 90000$, see [10]. Therefore, *for the computer search with large q* the *algorithm FOP* using the lexicographical order of the points seems to be *better than greedy algorithms*.

Moreover, investigations of complete lexiarcs for large q could help to understand the **enigma** connected with oscillation (with decreasing amplitude) of the values $h^L(q)$ around a horizontal line (see Figure 6, Observation 3.5, and Remark 3.6).

It would be useful also to understand the structure of lexiarcs, in particular, the initial part of a lexiarc that is the same for all lexiarcs with greater q, see Subsection 2.3.

Also, it would be interesting to understand the working mechanism and to do quantitative estimates for the step-by-step algorithm FOP, see (2.1), similarly to the work [8] where the working mechanism of a greedy algorithm is treated.

Finally, further investigations of random arcs and their "similarity" to lexiarcs, see Figures 7 and 8, would be useful.

This work can be considered as a continuation and development of the paper [11].
